

Minutes of Meeting: Midterms Paper Revisions, Use Case Synchronization, and C4 Architecture Corrections

Date: August 28, 2026

Time: 9:40 AM – 10:30 AM

Location: Room 206

Presiding: Ms. Rhea Luz Valbuena

Attendees: Rei Khalil S. Galido, Joshmar Clavero, Joshua Concepcion, Roman Rico Albania (Secretary)

1. Document Formatting & Scope Adjustments

- **Table of Contents & Template Cleanup:** Fix the Table of Contents by removing embedded paragraphs. Strip out all template comments and guidance notes throughout the document.
- **Scope and Limitations:** Remove the editorial constraint section from the project scope, as this scenario does not occur in actual operations.

2. Use Case Diagram & Actor Consistency

- **High-Level Diagram Restructuring:** Maintain only the high-level use cases on the main diagram and remove module breakdowns (modules belong in the Context Diagram).
- **Actor Realignment:** Ensure total consistency between high-level actors and sub-diagrams. Resolve discrepancies where sub-figures show extra actors (e.g., Figure 2 showing 5 personas while the high-level diagram only lists 4). Do not introduce new actors in detailed views unless they exist in the high-level diagram or are generalized properly. Include relevant personas across applicable use cases.

3. Fully Dressed Use Cases & Requirement Traceability

- **Traceability Matrix:** Note that Requirement Traceability belongs inside the Software Requirements Specification (SRS).
- **Cross-References & Flow Standards:** Fix the "Related Use Cases" sections—remove "None" where legitimate dependencies exist. Update actor designations to align with the high-level diagram or use generalization. Format all basic flows with structured step-by-step numbering.

4. Mockups & Test Case Mapping

- **1:1 Feature Mapping:** Ensure every process shown in the UI mockups corresponds directly to a documented use case (e.g., publishing confirmation must be explicitly documented inside the *Manage Publication* module).
- **Test Coverage:** Guarantee that every single use case has corresponding test cases. Add a dedicated Requirement Traceability column to the test case table.

5. C4 Architecture & Database Redesign

- **Visual Clarity & Terminology:** Redesign diagrams to fix readability issues. Standardize external system naming across diagrams and text (e.g., if using "Email Delivery Service," maintain that exact terminology throughout).
- **Level 1 (System Context):** Remove extra/unmatched actors to strictly align with high-level personas.
- **Level 2 (Containers):** Correct structural errors in Level 2; move all external systems strictly outside the system boundary.
- **Level 3 / Component Diagram:** Replace Level 3 with a formal Component Diagram. Do not generalize actors differently from the high-level diagram. Group components logically into packages matching the main navigation tabs/sections of the website.
- **Backend & Database Infrastructure:** Place the primary database strictly inside the backend boundary. Ensure data isolation rules prevent unauthorized external access to internal data. Leverage AI tools to assist in generating backend code.

Action Items & Deliverables

Task	Assigned To
Clean up paper formatting (remove TOC paragraphs, strip template comments, and update Scope/Limitations)	Team
Synchronize high-level actors across all use case figures, fix related use case references, and add numbered basic flows	Team
Add Requirement Traceability columns to Test Cases and ensure 100% test coverage for all use cases	Team
Cross-check UI mockups against use cases to ensure every visual interaction is mapped to a process	Team
Restructure C4 diagrams into a clean Component Diagram aligned with website navigation tabs	Team
Isolate the primary database within the backend architecture and enforce strict data access constraints	Team
