Minutes of Meeting: Deployment Diagram Specifications, Git Branching Strategy, and Agile Workflow Practices

Date: November 10, 202

Time: 12:30 – 1:30

Location: Room 405-D

Presiding: Mr. Felino Calderon III

Attendees: Rei Khalil S. Galido, Joshmar Clavero, Joshua Concepcion, Roman Rico Albania

1. Architectural Diagrams Review

- **Deployment Diagram Requirements:** The deployment diagram must explicitly detail all system nodes, hardware devices, and execution environments (software hosts). Key alignment rules include:
    - Any external system shown in the deployment diagram must have a corresponding representation in the use case diagram.
    - Security deployment layers must be clearly documented.
    - Instance capacity and scaling plans must be explicitly justified based on expected user traffic.
    - CI/CD pipelines and automated workflows (such as unit testing execution) must be incorporated.
- **Code Diagram:** The code diagram was reviewed and approved without further revisions.

2. Repository Management & CI/CD Strategy

- **Git Branching Policy:** Strict prohibition of direct commits to the main branch. All changes must be developed on separate branches and submitted via pull requests (archiving feature branches post-merge).
- **Environment Architecture:** Establish clear environment branches: Master, Sandbox, and QA.
- **Automated Pipelines:** Research and implement GitHub Actions / GitHub Pipelines for automated testing and continuous integration.

3. Project Management & Development Methodology

- **Use Case Tracking:** Practice and map all system use cases in a centralized tracking sheet (e.g., Excel).

- **Task Progress Reporting:** Configure automated project reporting in OpenProject (or Jira) tracking item completion across a 0% to 100% status range to verify complete scope delivery.
- **Development Practices:** Adopt pair programming sessions within team development workflows to improve code quality and collaboration.

Action Items & Deliverables

Task	**Assigned To**
Update the deployment diagram to include security layers, node types, traffic-based instances, CI/CD pipelines, and aligned use-case external systems	Team
Restructure the GitHub repository into Master, Sandbox, and QA branches, and enforce pull-request rules	Team
Research GitHub Pipelines / GitHub Actions for CI/CD setup	Team
Build an Excel tracking matrix covering all system use cases	Team
Configure OpenProject task progress reporting (0% to 100% completion tracking)	Team
Implement scheduled pair programming sessions for development tasks	All Members
